

Sources: How can I still obtain result records when using limits in queries regardless of whether a given Source Package supports the limit or not?

When using Muse applications, one has the choice to set "strict" or "loose" limits for the searches. With "strict" limits, Muse returns "Unsupported Query" errors if a Source Package which does not support the selected limit is included, while with the "loose" configuration unsupported limits are dropped.

To set one behavior or another, one must login into MCAA > select application > expand "Application Modules" > click "Search Module" > "Stop If Limiter Not Supported" option.
