

Muse Installation: What changes must be made when switching to Java 1.6?

No matter the OS, the JAVA_HOME variable must point to the newly installed Java version. The scripts that start the Muse servers upon system boot must also be modified.

For Windows OS:

- the corresponding line in the InstallXXXService.bat files (or service.bat for Tomcat) will need to be manually edited to point to the new JVM DLL.
 - uninstall Muse services - run UninstallXXXService.bat or service.bat remove for Tomcat
 - install again the services - run InstallXXXService.bat or service.bat install for Tomcat.
- Note that the last 2 operations must be done for each Muse service that must run. These files are located in the \$MUSE_HOME/http (\$MUSE_HOME/tomcat/bin), \$MUSE_HOME/proxy and \$ICE_HOME locations.

For non Windows OS:

- edit the /etc/init.d/muse file and change PATH to include the path to Java 1.6. Eg:
PATH=/usr/jdk/instances/jdk1.6.0/jre/bin:\$PATH
- Unique solution ID: #1111
